sequence search for 09/512,363

Please search the following sequences for 09/512,363:

commercial database and interference search for the following sequences: 1.

SEQ ID NO: 2(aa)

- 2. commercial database and interference search of SEQ ID NO: 2(aa) against nucleotide databases
- 3. oligomer search, commercial and interference databases, for SEQ ID NO: 2(aa)
- fragment search for SEQ ID NO: 2(aa): 4.

/amino acids -25 - 137 (if aa -25 is numbered as "1", then 1-162) " , then 26-162) ∠amino acids 1-137 then 26-139) amino acids 1-114 amino acids -25-139 , then 1-164) amino acids 21-139 then 46-164) then 33-154) amino acids 8-129 amino acids 8-48 then 33-73) amino acids 49-88 then 74-113) amino acids 89-129 then 114-154)

## Thanks

Anne Holleran AU: 1642 308-8892 Tel: Room: 8E03

Point of Contact: **Toby Port** Technical Info. Specialist CM1 1E01 TEL: 308-3534

<sup>\*</sup> note for fragment search: the application lists the fragments using the numbering of the specification which includes negative numbers. I have listed the fragments using the fragment numbering as listed in the claims and also the fragment numbers that would correspond if the first aa is numbered "1" and not numbered "-25".

development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the sgulation or development of haematopoietic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This is the amino acid sequence encoding the human 312C2 T cell protein. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antigen-specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                tumour necrosis factor receptor family. The sequence was deduced from a bone marrow cDNA clone (see AAX87670). Methods for the recombinant production of PRO364 polypeptides, e.g. in CHO, Escherichia coli or yeast host cells, are provided. Claimed polypeptides comprise amino acids 1-241, 1-X, 26-241 (i.e. the mature protein) and 26-X of the present sequence, where X is any one of amino acid respdies 157-167 of PRO364. PRO364 polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               immunoglobulin Fc region are also claimed. PR0364 can be used in assays to identify other proteins or molecules involved in binding interactions. This is useful for identifying inhibitors or agonists of receptor/ligand binding. The PR0364 polypeptides may also be combined with an agent that is cytotoxic, chemotherapeutic or a growth inhibitor. PR0364 antibodies are useful in diagnostic methods, purification methods and also in therapy, e.g. as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents human PRO364, a novel member of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      are useful for modulating apoptosis, NF-KB activation and proinfiammatory or autoimmune responses in mammalian cells (claimed). Chimeric molecules comprising a PRO364 polypeptide fused to a heterologous sequence such as epitope tag or

Peptide Protein

```
This is the amino acid sequence encoding the human 312C2 T cell protein. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antigen-specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous onditions or degenerative conditions. They can be used in the egulation or development of haematopoietic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.
                                                                  Human 312C2 T cell protein; thymus cell; spleen cell; T cell;
antigen-specific T cell proliferation; cytokine production by T-cell;
apoptosis; cancer; haematopoletic cells; lymphoid cell;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated 312C2 T cell gene - used to develop products for treating, e.g. cancers, auto-immune disorders, transplantation rejection and other T cell disorders
                                 Amino acid sequence of the human 312C2 T cell protein.

                                                                    The present sequence represents human PR0364, a novel member of the tumour necrosis factor receptor family. The sequence was deduced from a bone marrow cDNA clone (see ANX87610). Methods for the recombinant production of PR0364 polypeptides, e.g. in CHO.

Escherichia coli or yeast host cells, are provided. Claimed polypeptides comprise amino acids 1-241, 1-X, 26-241 (i.e. the mature protein) and 26-X of the present sequence, where X is any one of amino acid respoises 157-167 of PR0364. PR0364 polypeptides proinfilmmatory or autoimmune responses in mammalian cells
                                                                                                                                                                                                                                                                                                                                                                                                                                           (claimed). Chimeric molecules comprising a PRO364 polypeptide fused to a heterologous sequence such as epitope tag or immunoglobulin For region are also claimed. PRO364 can be used in assays to identify other proteins or molecules involved in binding interactions. This is useful for identifying inhibitors or agonists of receptor/ligand binding. The PRO364 polypeptides may also be combined with an agent that is cytotoxic, chemotherapeutic or a growth inhibitor. PRO364 antibodies are useful in diagnostic methods, purification methods and also in therapy, e.g. as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Length 241;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Indels

                                                                                                                                                                                                                                                                                                                                                     This is the amino acid sequence encoding the human 312C2 T cell protein. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 313C2 stimulates proliferation of T cell clones, antigen specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or appotbasis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoietic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.

                                                                                                                                                                                                                                                                                assays to identify other proteins or molecules involved in binding interactions. This is useful for identifying inhibitors or agonists of receptor/ligand binding. The PRO364 polypeptides may also be combined with an agent that is cyctoxic, chemotherapeutic or a growth inhibitor. PRO364 antibodies are useful in diagnostic methods, purification methods and also in therapy, e.g. as
tumour necrosis factor receptor family. The sequence was deduced from a bone marrow cDNA clone (see AAX87670). Methods for the recombinant production of PRO364 polypeptides, e.g. in CHO, Escherichia coll or yeast host cells, are provided. Claimed polypeptides comprise amino acids 1-241, 1-x, 26-241 (i.e. the mature protein) and 26-x of the present sequence, where x is any one of amino acid respaise 157-167 of PRO364. PRO364 polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    endothellal; anglogenic disorder; PRO179;

2000-182699/16. N-PSDB; AAZ49948 Polypeptides and polynucleotides useful for treating and detecting cell proliferation disorders e.g. actinic keratosis, and immune disorders e.g. Crohn's disease

Claim 1; Pages 64-65; 67pp; English.

The present sequence is a molecule associated with cell prollferation, MACP-5 from Incyte clone 2809903 isolated from TLYMNOT06 cDNA -library. This sequence is expressed in cardiovascular and haematopoietic/lmmune tissues. MACP shows antiarteriosclerotic, anti-HIV, hepatoticopic, antiinflammatory, antipsoriatic, cytostatic, antiasthmatic, dermatological, antidiabetic, nephrotropic, antithyroid, thyromimetic, immunosuppressive, osteopathic, antiarthritic, uropathic, antiucer, and ophthalmological activities. The present sequence is useful in the diagnosis, treatment and prevention of cell proliferative disorders e.g. actinic keratosis, arteriosclerosis, atherosclerosis, bursitis and hepatitis, and immune disorders e.g. Crohn's disease, amyloidosis and anaemia

```
This is the amino acid sequence encoding the human 312C2 T cell protein. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement 5 312C2 stimulates proliferation of T cell Clones, antigen-specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoietic cells, e.g. lymphoid cells

recombinant production of PR0364 polypeptides, e.g. in CHO, Bscherichia coli or yeast host cells, are provided. Claimed polypeptides comprise amino acids 1-241, 1-X, 26-241 (i.e. the mature protein) and 26-X of the present sequence, where X is any one of amino acid respdies 157-167 of PR0364. PR0364 polypeptides are useful for modulating apoptosis, NF-KB activation and proinflammatory or autoimmune responses in mammalian cells (claimed). Chimeric molecules comprising a PR0364 polypeptide (issed to a heterologous sequence such as epitope tag or immunoglobulin Fc region are also claimed. PR0364 polypeptide immunoglobulin Fc region are also claimed. PR0364 polypeptide interactions. This is useful for identifying inhibitors or aponters of receptor/ligand binding. The PR0364 polypeptides may also be combined with an agent that is cytotoxic, chemotherapeutic or a growth inhibitor. PR0364 antibodies are useful in diagnostic articles, purification methods and also in therapy, e.g. as

he present sequence is a molecule associated with cell rollferation, MACP-5 from Incyte clone 2809903 isolated from TLYMNOTO6 coll illustriance. MACP-5 from Incyte clone 2809903 isolated from TLYMNOTO6 coll illustriance. MACP-5 shows antiarteriosclerotic, anti-HIV, hepatotropic, antiinflammatory, antipsoriatic, cytostatic, antiasthmatic, dermatological, antidiabetic, nephrotropic, antiinfrominetic, antiannosuppressalve, osteopathic, antiarthritic, uropathic, intiulcer, and ophthalmological activities. The present sequence is useful in the alignosis, treatment and prevention of cell proliferative disorders e.g. actinic keratosis, arterlosclerosis, atherosclerosis, bursitis and hepatitis, and immune disorders e.g. Crohn's disease, amyloidosis and

Amino acid sequence of the human 312C2 T cell protein.

(first entry)

28-JUL-1998

```
This is the amino acid sequence encoding the human 312C2 T cell protein. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antigen-specific proliferation and cytokine production by T-cells, and potentiates T treatment of conditions associated with abnormal physiology or treatment, of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoietic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

```
receptor-like protein (TRII receptor). The invention relates to TRII and two splice variants TRIISV1 and TRIISV2. The nucleotide sequences were determined by sequencing cloned coDNAs AAZ37765-23776. The TRII receptor and its splice variants show homology to the murine glucocorticoid induced tumnour necrosis factor receptor family-related gene (GITR).

TRIISVI and TRIISV2 polypeptides may be involved in the regulation of cell-type specific receptor-mediated cell growth, differentiation, agonists/antagonists. The polypeptides, agonists or antagonists can be used for treating a disease state associated with aberrant cell survival. They can be used for treating immune deficiency disorders, blood coagulation disorders, blood cagulation cagula
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                hypersensitivity to an antigenic molecule, organ rejection or graft versus host disease, inflammatory conditions, ischaemia-reperfusion injury, complement-mediated hyperacute rejection, nephritis, cytokine or chemokine induced lung injury, inflammatory bowel disease, crohn's disease, hyperproliferative disorders, or infections. They can also be used to repair, replace, or protect tissue damaged by congenital defects, trauma, age, disease, surgery, including cosmetic plastic surgery, fibrosis, reperfusion injury, peripheral nerve injuries, neuropathies, and central nervous system disease (e.g. Alzheimer's disease, parkinson's disease, Huntington's disease, amyotrophic lateral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sclerosis, and Shy-Drager syndrome). The products can also be used for

protein. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell chones, antigen-specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoietic cells, e.g. lymphoid cells which affect immunological responses, e.g. autbimmune disorders. Amino acid sequence of the human 312C2 T cell protein.

28-JUL-1998 (first entry)

AAW37839;

```
The present sequence is a molecule associated with cell notification, MACP-5 from Incyte clone 2809903 isolated from TLYMNOT06 CDNA library. This sequence is expressed in cardiovascular and haematopoletic/lmmune tissues. MACP shows antiarteriosclerotic, anti-HIV, hepatotropic, antinflammatory, antipsoriatic, cytostatic, antiasthmatic, dermatological, antidiabetic, nephrotropic, antihyroid, thyromimetic, immunosuppressive, osteopathic, antiarthritic, uropathic, antiulcer, and ophthalmological activities. The present sequence is useful in the diagnosis, treatment and prevention of cell proliferative disorders e.g. actinic keratosis, arteriosclerosis, atherosclerosis, bursitis and hepatitis, and immune disorders e.g. Crohn's disease, amyloidosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polypeptides and polynucleotides useful for treating and detecting cell proliferation disorders e.g. actinic keratosis, and immune disorders e.g. Crohn's disease

protein. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antigen-specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoietic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Polypeptides and polynuclectides useful for treating and detecting cell proliferation disorders e.g. actinic keratosis, and immune disorders e.g. Crohn's disease

Claim 1; Pages 64-65; 67pp; English.

The present sequence is a molecule associated with cell proliferation, MACP-5 from incyte clone 2809903 isolated from TLYMNOT06 CDNA library. This sequence is expressed in cardiovascular and heamatopoietic/immune tissues. MACP shows antiarteriosclerotic, anti-HIV, dermatological, antidialetic, antipsoriatic, cytostatic, antiasthmatic, immunosuppressive, osteopethic, antidarthritic, uropathic, antiulcer, and ophthalmological activities. The present sequence is useful in the diagnosis, treatment and prevention of cell proliferative disorders e.g. actinic keratosis, antiarcosis, atherosclerosis, bursitis and hepatitis, and immune disorders e.g. Crohn's disease, amyloidosis and

e.g. cancers, auto-immune disorders, transplantation rejection and other T cell disorders Isolated 312C2 T cell gene

Claim 2; Pages 59-60; 71pp; English.

This is the amino acid sequence encoding the human 312C2 T cell protein. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antigen specific proliferation and cytchine production by T cells, and potentiates T proliferation or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or treatment, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoietic cells, e.g. lymphoid cells

recombinant production of PRO364 polypeptides, e.g. in CHO,
Escherichia coli or yeast host cells, are provided. Claimed
polypeptides comprise amino acids 1-241, 1-X, 26-241 (i.e. the
mature protein) and 26-X of the present sequence, where X is any
cone of amino acid respoides 157-167 of PRO364. PRO364 polypeptides
are useful for modulating apoptosis, NF-KB activation and
proinfiammatory or autoimmune responses in mammalian cells
(claimed). Chimeric molecules comprising a PRO364 polypeptide
tused to a heterologous sequence such as epitope tag or
immunoglobulin Fc region are also claimed. PRO364 polypeptide
interactions. This is useful for identifying inhibitors or
agonists of receptor/ligand binding. The PRO364 polypeptides may
also be combined with an agent that is cyctoxic, chemicherapeutic
or a growth inhibitor. PRO364 antibodies are useful in diagnostic
inhibitors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 CITCRHHPCPPGQGVQSQGKFSFGFQCIDCASGTFSGGHEGHCKPWTDCTQFGFLTVFPG 120

This is the amino acid sequence of the human tumour necrosis factor receptor-like protein (TRII receptor). The invention relates to TRII and teceptor-like protein (TRII receptor). The invention relates to TRII and two variants TRIISVI and TRIISV2. The nucleotide sequences were determined by sequencing cloned COMAS AA237765-237766. The TRII receptor family related gene (GITR).

Induced Lumour necrosis factor receptor family related gene (GITR).

TRII, TRIISVI and TRIISV2 polypeptides may be involved in the requiation.

CC fall-type specific receptor-mediated call growth, differentiation, discontraction of the used for treating a disease state associated with abbrrant cell survival. They can be used for treating immune deficiency disorders, blood survival. They can be used for treating immune deficiency disorders, blood placeds syndrome, HIV infection, severe combined immunodeficiency from a second for treating immune deficiency disorders, blood placeds syndrome, HIV infection, severe combined immunodeficiency from a survival. They can be used for treating immune deficiency disorders, blood placeds used to treat heart attacks, strokes, Addison's disease, also be used to treat heart attacks, strokes, Addison's disease, also be used to treat heart attacks, strokes, Addison's disease, ansultiple solerosis, myasthenia gravis, Stiff-Man syndrome, systemic lupus erythematosus, Guillann-Barre syndrome, insulin dependent of the placed of an antiquent molecule, organ rejection or graft versus host disease, inflammatory oconditions, ischaemia reperfusion of disease, inflammatory or organ rejection or graft versus host disease, inflammatory conditions, ischaemia and central nervous system disease, can be used to repair, reperfusion injury, postpheral nerve any protect tissue demaged by congenital callers. And short and subjects or protect tissue demaged by congenital nerve as system disease, parkinson's disease, matching or any protect surgery, fibrosis, reperfusion injury, partipheral nerve injures and central nervous syst
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sclerosis, and Shy-Drager syndrome). The products can also be used for

(first entry) 28-JUL-1998

Amino acid sequence of the human 312C2 T cell protein.

```
protein. The 312C proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antigen-specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the
              Human 312C2 T cell protein; thymus cell; spleen cell; T cell; antigen-specific T cell proliferation; cytokine production by T-cell; apoptosis; cancer; heamatopoletic cells; lymphoid cell; autoimmune disorders.

                                                                                                                                                                                                                                                                                                                                                                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                         US-09-512-363-2_COPY_1_164

SUBUNIT: HOMODIMER (MAJOR PERM) AND MONOMER (MINOR FORM).
SUBCELLULAR LOCATION: EXPRESSED AT HIGH LEVELS IN LIVER, LUNG, BRAIN, HEART, KIDNEY, STOMACH, INTESTINE, SKIN, CALVARIA AND PLACENTA. NOT DETECTED IN SPLEEN
DEVELOPMENTAL STAGE: IN THE EMBRYO, HIGH LEVELS ARE DETECTED AT AV 7. AT DAY 11, EXPRESSION DECREASES AND THEN INCREASES FROM DAY SIN DAY 17.
SIMILARITY: CONTAINS A LA-NGFR/THER-TYPE CYSTEINE-RICH REGION.
